

KEITH SOYKA

AI Systems Builder & Implementation Advisor

I build working AI systems, not slide decks. Fifteen months solo, unfunded, production-shipped.

THE PROOF — verified, not claimed (figures as of Aug 2026)

722 TypeScript files shipped	217 Postgres tables, 299 RLS policies	75 database functions in production
768-dim corpus embeddings, production retrieval	4 platforms live: web, Discord, Reddit, Slack	Top 4% Pepperdine Most Fundable Co. Quarterfinalist — top 100 of 2,300

WHAT I'VE BUILT

- **GestaltView** (May 2025–present, solo founder) — personal AI continuity platform: Next.js / Supabase / Vercel, Stripe billing, pgvector retrieval. Multi-LLM runtime (cost-efficient models do groundwork, frontier models handle review). Corpus ingestion is additive and idempotent; every claim traceable to evidence.
- **Billy**, the runtime agent at its center — one hardened core serving web, Discord, Reddit, and Slack. LLM cascade with graceful fallback (Groq → Gemini → Claude → GPT → local); every response reports its provider. Voice interface, safety layer, self-diagnostics.
- **Shipped product surfaces**: client agent-training service (Stripe live), embodiment-profile generator (JSON schema + Python CLI), retrieval-backed knowledge systems, automated monitoring agents.

QUALIFICATIONS — named from the runtime

- **Production RAG — hybrid semantic + keyword retrieval, five-stream fusion, embedding pipelines, graceful degradation at every step.**
- **Cost-aware LLM orchestration — multi-provider cascade, free/local-first routing, per-response provider and cost reporting.**
- **Persona consistency systems — schema-driven embodiment compiler (25 profiles), drift detection, voice-preservation scoring.**
- **AI evaluation discipline — evidence-first rubric: every capability labeled verified / partial / planned / unsupported, never assumed.**
- **Orchestration layer — content-kind routing across surfaces; Transcriptory voice-ingestion pipeline; profile pipeline; generative + render engine.**
- **Incident diagnosis — cross-boundary debugging (client → API → database → storage), documented repairs with tests.**
- **Security-minded data handling — owner-scoped queries, private-by-default, consent-aware storage.**

WHAT I DO FOR CLIENTS

- **Custom AI agent systems for businesses** — scoped, built, and deployed; multi-agent orchestration with real data, not demos.
- **Retrieval & knowledge systems over private corpora** — RAG that survives contact with reality: evidence standards, audit trails, no hallucinating the gap shut.
- **AI implementation advisory for operators** — I speak P&L, not just Python. 22+ years running multi-site operations before I ever shipped code.

BACKGROUND

- **22+ years frontline operations leadership** — multi-site P&L, labor, inventory. Then self-taught builder: Python, TypeScript, Java; React, Postgres/Supabase, retrieval, orchestration, governance.
- **How I work**: evidence before claims, full-file handoffs, inspect-before-editing, roll forward. I compare outputs across models and test against ground truth I know cold.

RECOGNITION

- **Pepperdine Most Fundable Companies 2025** — Quarterfinalist, top 100 of 2,300 startups.

Available for advisory, consulting, and bespoke implementation — structured so building stays first. References and code walkthrough on request.
